

Are there any irregular lines on the photovoltaic panels

Overview

Snail trails are thin, dark lines that appear on the surface of the panel, usually a few years after installation. They are caused by micro-cracks or defective front-side silver paste used during manufacturing, which allows oxidation to occur. However, sometimes they separate which is called the delamination of solar panels. This cloudiness is often caused by moisture ingress. Once the seal between layers fails, water vapor enters the panel. As the temperature fluctuates, this vapor can condense. Delamination occurs when the protective layers of tempered glass and plastic backsheet peel apart, allowing moisture to penetrate and cause corrosion inside the panel.
