

Differences and connections between virtual power plants and microgrids

Overview

A microgrid is a localized energy grid with its own generation sources and load demands, while a VPP aggregates diverse distributed energy resources (DERs) to operate as a single power plant. Virtual Power Plants (VPPs) and Microgrids are two innovative solutions at the forefront of this transformation, working in harmony to reshape the energy landscape. In this essay, we will explore the concept of VPPs and the pivotal role that Microgrids play in enabling their success. These systems utilize distributed energy resources (DER) to generate power near or on-site to the need, independent of the centralized power . This essay aims to shed light on the distinctions between VPPs and Microgrids while providing insights into the broader energy landscape. 30% of the world's electricity was generated using renewable energy sources in 2024, indicating a move toward robust and .
