

Does the rear leg of the photovoltaic bracket need to be supported diagonally

Overview

The front and rear pieces of the installation are supported diagonally on the sides, that is, diagonal beams, which serve as structural reinforcements. After assembly, ensure that the rear bracket mullions are at right angles to the ground. That's exactly what happens when you install solar arrays without proper rear stabilization. Let's face it - most people get starry-eyed about solar panels themselves, completely. The bracket is set up with long and short legs before and after the bracket, and the legs are bolted to the foundation respectively, one end of the diagonal brace is supported at the foot of the long column, and the end of the middle part is a diagonal beam, and the longitudinal direction is. To ensure the smooth installation of photovoltaic system brackets and meet design requirements, Guidance Method For The Installation Of PV System Brackets are provided, including ground-mounted, rooftop, adjustable tilt angle, floating, Building-Integrated Photovoltaics (BIPV), bifacial, and.
