## Overview

---

Simulating an electric-drive vehicle, energy storage system, and serial regenerative brake system that consists of a hydraulic brake and an electric motor that works as a brake actuator. es to the field of mining machinery. It can recover and store regenerative energy produced by braking a motion generator with intermittent rotary velocity such as the rotor of a wind turbogenerator subject to intermittent intake wind and the axels o . The study builds on the previous COMET study on Energy Efficiency, which was conducted last year as metros experienced increasing energy costs driven up by the conflict in Ukraine. This study examined how members use recovered braking energy and reviewed the extent and use of energy storage systems . At present, many automobile companies have established a vehicle electric energy storage braking energy recovery system, which is specially used to strengthen the development and utilization of braking energy, and to some extent alleviate the development trend of energy loss.
