

Exhaust of generator set

Overview

A gen set exhaust system must collect gases from engine cylinders and discharge them as quickly and silently as possible. It must minimize back pressure, which can cause horsepower losses and temperature increases that can shorten the engine's life. Diesel generator sets generate a large amount of heat during operation. Once the diesel generator set operates in an environment with excessively high temperature, its load - carrying capacity will also decline. While the engine's cooling system carries away roughly one-third of the fuel's heat, another third leaves the set as hot exhaust gas. If that energy is not channelled and attenuated . General (Exhaust System)

Generator engines give off deadly carbon monoxide gas through their exhaust systems. offers silencers rated for hospital, critical, residential, and industrial applications and stainless steel flexible exhaust connectors for unhoused generator sets.
