

How many components should be connected in series for a 20kW inverter

Overview

If an inverter has a maximum input voltage of 600V and each panel produces 40V, you could connect up to 15 panels in series ($15 \times 40V = 600V$). Going over this voltage limit can harm the inverter or make it shut down, making your solar system less effective or even unusable. Now, when multiple panels are connected correctly in series and parallel, their combined voltage and current perfectly match the input window of the inverter. So, how many solar panels can be connected to a solar inverter?

This number depends on the specifications of the inverter and solar panels, such as the . For many new to photovoltaic system design, determining the maximum number of modules per series string can seem straight forward, right?

Simply divide the inverter's maximum system voltage rating by the open circuit voltage (Voc) of the module used and you're good. This calculator automatically checks .
