

Is it OK to connect the switching power supply to the photovoltaic panel

Overview

There is no need to transfer the electricity supply from one source to the other! When solar panels produce electricity, the electrical installation is powered by both the grid, and by the photovoltaic system. When sunlight hits a solar cell, electrons move and create direct current (DC) electricity. The system collects this DC power and sends it to an inverter, which changes it to alternating current (AC) . Wiring a simple solar photovoltaic (PV) system with a combiner box, charge controller, and breaker box. An ATS ensures a seamless transition between your solar inverter, battery backup, and utility grid - keeping your lights on, equipment running, and power stable without manual intervention.
