

Microgrid power load prediction method

Overview

To ensure the rapidity, accuracy, and efficiency of load prediction in a microgrid system, deep learning is introduced into microgrid load prediction, and we propose a method for the short-term load prediction of a microgrid system based on multivariable and multistep long . To ensure the rapidity, accuracy, and efficiency of load prediction in a microgrid system, deep learning is introduced into microgrid load prediction, and we propose a method for the short-term load prediction of a microgrid system based on multivariable and multistep long . Firstly, the introduction of the multi-variable uniform information coefficient (MV-UIC) is proposed for extracting the correlation between weather characteristics and the sequences of source and load power. Subsequently, the application of factor analysis (FA) is introduced to reduce the . Efficient energy management and accurate load forecasting are one of the critical aspects for improving the operation of microgrids. In this work, a novel energy management . The growing integration of renewable energy sources into grid-connected microgrids has created new challenges in power generation forecasting and energy management. This paper proposes a closed-loop technical framework combining high-confidence interval prediction, second-order cone convex relaxation, and .
