

Plasma and Energy Storage Container Hybrid Type for Oil Refineries

Overview

This paper evaluates the energy requirements, associated greenhouse gas emissions, and energy economics of using plasma processing technology for heavy oil upgrading in refineries by replacing the fluid catalytic cracker unit using a model called petroleum refinery life . This paper evaluates the energy requirements, associated greenhouse gas emissions, and energy economics of using plasma processing technology for heavy oil upgrading in refineries by replacing the fluid catalytic cracker unit using a model called petroleum refinery life . Plasma-assisted oil refining is a new approach that increases the efficiency and selectivity of crude oil upgrading. Traditional refining methods are thermal and catalytic, are energy-consuming, and have limitations in cracking heavy hydrocarbons. Plasma technology creates a high-energy environment . The BSI-Container-20FT-250KW-860kWh is built to solve the challenges of remote energy access, operational continuity, and scalable storage. It serves industrial and commercial entities that require Customize your container according to various configurations, power outputs, and storage capacity . This study aims to evaluate a proposed hybrid heating system for heavier refinery products in storage tanks, coupled with TES, including energy, cost, and GHG emission analysis. Refinery Storage Tanks are the critical cardiovascular system of any downstream facility, serving as the primary buffer between incoming crude oil feedstocks and outgoing refined products.

Plasma and Energy Storage Container Hybrid Type for Oil Refineries

Plasma Technology Applications in the Oil Industry

Plasma technology is transforming the oil industry by offering efficient, eco-friendly, and high-performance solutions for refining, purification, waste treatment, and enhanced oil recovery.
