

Solar energy storage fluid color

Overview

A common example of such a system is a metal plate that is painted a dark color to maximize the absorption of sunlight. Different types of fluids are commonly used for storing thermal energy from concentrating solar power (CSP) facilities. To store heat for days, weeks, or months, you need to trap the energy in the bonds of a molecule that can later release it. Solar thermal systems have gained significant popularity, with recent industry reports suggesting that industries must adopt Heat Transfer Fluids that effectively facilitate the capture and transfer of solar energy. Traditionally, CSP plants have used synthetic oils as heat transfer fluids and molten salts for storage. Heat-transfer fluids carry heat through solar collectors and a heat exchanger to the heat storage tanks in solar water heating systems. Concentrating collectors have a much larger area.
