

The development focus of solar power generation

Overview

This paper highlights solar energy applications and their role in sustainable development and considers renewable energy's overall employment potential. These devices, known as solar cells, are then connected to form larger power-generating units. Solar energy is the most widely available energy resource on Earth, and its economic attractiveness is improving fast in a cycle of increasing investments. Here we use data-driven conditional technology and economic forecasting modelling to establish which zero carbon power sources could become. The vision and long-term goal of the Center for a Solar Powered Future (SPF2050) is to enable the United States and the world to achieve a zero carbon footprint by 2050 using solar energy as a resource. SPF2050 is catalyzing breakthrough pre-competitive research for the solar power industry by. This study examines the sources of energy related carbon dioxide (CO₂) emissions, the hazards of climate change and greenhouse gas (GHG) emissions, the global solar energy potential, renewable energy sustainability indicators, impediments, and the environmental implications of fossil fuels.
